

Q No.	PAPER NAME	Uncertainty Modelling for Intelligent Systems	Q.SETTER INITIALS	JL	Marks
1(a)(i)	P1: $P(W) = 1$ and $P(\emptyset) = 0$, P2: If $A \cap B = \emptyset$ then $P(A \cup B) = P(A) + P(B)$.				2
1(a)(ii)	Since $A \subseteq B$ then $B = A \cup (B \cap A^c)$ where A and $B \cap A^c$ do not overlap. Hence by P2 $P(B) = P(A) + P(B \cap A^c) \geq P(A)$.				3
1(b)(i)	By Bayes theorem $P(H_i E) = \frac{P(E H_i)P(H_i)}{P(E)}$ and since $P(E)$ is constant for each H_i we have that $P(H_i E) \propto P(E H_i)P(H_i)$. Now $P(E H_1)P(H_1) = 0.8 \times 0.2 = 0.16$, $P(E H_2)P(H_2) = 0.6 \times 0.7 = 0.42$ and $P(E H_3)P(H_3) = 0.5 \times 0.1 = 0.05$.				2
	Hence, H_2 is most probable give E .				1
1(b)(ii)	By the theorem of total probability $P(E) = P(E H_1)P(H_1) + P(E H_1^c)(1 - P(H_1)) = 0.8 \times 0.2 + 0.3 \times 0.8 = 0.4$.				2
	Hence, by Bayes theorem $P(H_1 E) = \frac{0.8 \times 0.2}{0.4} = 0.4$				1
1(c)(i)	The gain for Bet 1 is $S(1 - p)\chi_A(w^*) - Sp(1 - \chi_A(w^*)) = S((1 - p)\chi_A(w^*) - p(1 - \chi_A(w^*))) = S(\chi_A(w^*) - p\chi_A(w^*) - p + p\chi_A(w^*)) = S(\chi_A(w^*) - p)$				3
	The gain for Bet 2 is $-S(1 - p)\chi_A(w^*) + Sp(1 - \chi_A(w^*)) = -\text{Bet 1 gain} = -S(\chi_A(w^*) - p)$				1
1(c)(ii)	For odds p' then Bet 1 gain is $S(\chi_A(w^*) - p') \geq S(\chi_A(w^*) - p) = \text{Bet 1 gain for odds } p$				2
	Also, the gain for Bet 2 given odds p' is $-S(\chi_A(w^*) - p') \leq -S(\chi_A(w^*) - p) = \text{Bet 2 gain for odds } p$				1
	Hence, if the agent chooses Bet 1 when offered odd p then she should also choose Bet 1 when offered odd p' since in the latter case the Bet 1 gain will be higher and the Bet 2 gain lower than in the former case.				1
